

Daily collection (24 h) of urinekype

General information

If you use the toilet and forget to collect, tap out or spill, the urine collection must be repeated from the beginning. Make sure that the lid of the container is screwed on tightly.

Urinate in the toilet before starting urine collection and make a note of the time.

Next time you need to use the toilet: Urinate in an unused vessel, such as a glass or plastic cup. Then carefully pour the urine into the plastic container. **REMEMBER!** Do not use a paper cup. Keep the container in a cool place during collection.

Urinate one last time the next day at the same time you started (24 hours later). Then stop the urine collection. Keep the container in a cool place until submission.

Attach a barcode label or a label with your personal identity number and name on the plastic container.

Take the plastic container to your healthcare centre or sample collection unit. Bring your ID with you.
